Actual angle-pair distributions in the original 512D space
Each panel contains all 18,432 validation edges. Green region: phi <= psi.
Original C0
lambda=.1, c=1, tau=.07
S = 0.0%
Min excess = 41.53 deg
Current fixed
lambda=.2, c=1, tau=.035
S = 0.0%
Min excess = 22.85 deg
Current learned
lambda=.2, c=.6171, tau=.04365
S = 0.0%
Min excess = 17.81 deg
Exterior angle phi (degrees)
Cone half-aperture psi (degrees)
Edges per hexagon (log scale)
Axes are actual cone diagnostics, not reduced embedding coordinates. All shown edges satisfy the radial-domain validity check.
A wider cone alone does not establish semantic entailment; the child angle must enter the green region.
